

## **Team-Evaluation and Reflection**

Overall, our team did well together, but there are always things we can improve. Attendance-wise, Sam missed quite a few meetings but this was due to getting called into work so this isn't anything he could improve. Caleb had a good amount of unexcused absences but he made it up through his out-of-class research. Josh had great attendance in this class, only missing one every once in a while.

I believe that everyone created high-quality work for this project and there isn't anything negative I can say about this. Sam was very timely in his work and would always provide what was needed without a long turnaround. Josh and Caleb had a thing or two that we received a little later than expected but it didn't seem like a time management issue, instead something that they needed assistance with.

Everyone did a great job with self-managing and finding the resources needed to push the project forward. I think that everyone overestimated their abilities to some extent, but that was most likely due to not being very familiar with doing something like this before. Thankfully, there was not any conflict between team members over the course of this project.

Sam did an amazing job as the lead of this project because he had the most experience out of everyone in the group. He and Caleb did a great job with the role of miner/wrangler and Caleb was effective as a manager making sure that everyone was doing what had to be done. Josh fulfilled his role as a documenter well and gave us a

great outline of where we should be in the timeline of this project. He also did a good job researching possible methods and techniques we could use during the early stages of development. The roles that everyone had were as they should've been in my opinion. Next time, due to Sam being gone, I believe that having Caleb as lead, and either myself or Josh as manager while keeping all of the rest of the roles the same would provide the most effective workflow for a project.
